Submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This enzyme condenses acetyl-CoA with acetoacetyl-CoA to form HMG-CoA, which is the substrate for HMG-CoA reductase (By similarity).
-!- CATALYTIC ACTIVITY: Acetyl-CoA + H(2)O + acetoacetyl-CoA = (S)-3-hydroxy-3-methylglutaryl-CoA + CoA.
-!- PATHWAY: Production of mevalonate from HMG-CoA prior to the synthesis of sterols and isoprenoids.
-!- SIMILARITY: Belongs to the HMG-CoA synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                               The invention discloses an isolated nucleic acid molecule encoding a human hydroxymethylglutaryl-coenzyme A (HMG-CoA) synthase which is important in cholesterologenesis. The polynucleotide and polypeptide are cuseful as models for the development of human therapeutic targets, to aid in the identification of therapeutic proteins and as targets for the development of human therapeutic agents that modulate the activity of the polypeptide in cells and tissues. The polynucleotide is useful for composition the effectiveness of modulating compounds on the expression or monitoring the effectiveness of modulating compounds on the expression or cacid, to detect mutations in clinical trials and in treatments, in diagnostic assays for qualitative changes in expression of enzyme nucleic such a mRNA, for testing an individual for a genotype and as a diagnostic cardet that can be used to tailor treatment in an individual. The polypeptide is useful to raise antibodies, as a reagent in assays designed to quantitatively determine levels of the protein in biological to members of the synthase subfamily, in drug screening assays, in cell-based or cell-free systems, in competition binding assays, in cell-based or cell-free systems, in competition binding assays, in cell-based or characterised by an assquence of, inappropriate, or unwanted expression of the polypeptide. The sequence presented is the human HMG-CoA synthase protein cDNA, the gene of core which is located on chromosome 5
                                                                                                                                                                                                                                                                                                                                              Query Match 100.0%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            therapeutic proteins, as targets for development of human therapeutics, for identifying agents, and as guery sequences to perform a search against sequence data bases to identify other family members of related sequences. The polypeptide is useful to raise antibodies or to elicit another immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is preferentially expressed, in drug screening assays, in cell-based or cell-free systems, to identify compounds that modulate synthase activity of the protein in its natural state, or an altered form that causes the specific disease or pathology associated with the synthase, to screen a compound for the ability to stimulate or inhibit interaction between the synthase protein and a molecule that normally interacts with the synthase protein, and in pharmacogenomic analysis. The polynucleotide is useful for monitoring the effectiveness of modulating compounds on the expression or activity of the human synthase gene in clinical trials or in a treatment regimen, in diagnostic assays for qualitative changes in a human synthase nucleic acid that leads to a pathology, for testing an individual for a genotype that while not necessarily causing a disease, nevertheless affects the reatment modality, and as antisense constructs to control human synthase encodes human HMG-COA synthase-like enzyme. The gene encoding the enzyme is located on chromosome 5

Composition comprising several cDNAs that treated human C3A liver cell cultures, use disorders. nat are differentially expressed useful for treating liver

Claim SEQ ID NO 98; 41pp; English

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a og a

The composition is useful for detecting and quantifying differential gene expression, can be used in gene formulate prognosis and to design a treatment regimen and to nefficacy of treatment. The present sequence represents a cDNA differentially expressed in a liver disorder.
                                                                                                                                                                                                                                                                                                                                                                     O

                                                                                                                                                                    The invention relates to isolated polynucleotide (I) and polypeptide (II) cequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed centivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in conditions for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and coding sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome characteristic disease, hypertension, congenital heart defects, aortic stenosis, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host cdisease, anorexia, cancer-associated cachexia, cancer, halzheimer's disease, anorexia, cancer-associated cachexia, cancer, halzheimer's disease, Parkinson's disease, immune disorders, cancer, caches, which are used in examples from the present invention.

Charcacteristic anticological in the exemplification of the present invention with the human NOV35b protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

Claim 20; Page 241; 460pp; English.

XX

CC The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, CC Appotensive, dermatological, anorectic, immunosuppressive, cycostatic, CC antidiabetic, antiinfertility, haemostatic, neuroprotective, notropic, CC antiparkinsonian and antilipaemic activities, and can be used in gene CC therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome CC associated with the human disease. NOVX nucleic acids, proteins and CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, disbetes, metabolic disease, tuberous sclerosis, scleroderma, obesity, transplantation, CC disorders, nooplasm, lymphoma, uterus cancer, fertility, haemophilia, hyperplasia, prostate cancer, disbetes, metabolic disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, hearting cancer associated cachexia, cancer, ACC62346 to ACC6245 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention.

CC ABR54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antiidabetic, antiinfertility, heemostatic, antiinflammatory, anti-HIV, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and disgnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host chsease, anoschial asthma, Crohn's disease, multiple sclerosis, alternation, cancer disease, multiple sclerosis, alternation, cancer, disease, multiple sclerosis, alternation disease, manders, cancer, alternation disease, manders, cancer, alternation disease, manders, cancer, cancer, alternation, cancer, disease, multiple sclerosis, cancer, alternation, cancer, disease, multiple sclerosis, cancer, cancer, disease, manders, disease, multiple sclerosis, cancer, alternation, cancer, disease, multiple sclerosis, cancer,

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antialabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NoVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital edisease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host chiesese, anorexia, cancer-associated cachexia, cancer, halps, bronchial asthma, Crohn's disease, immune disorders, cancer, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X. Acc62346 to ACC62465 represent PCR primers and probes for human NOVX seguences, which are used in examples from the present invention.

Charleting the human novasb protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human proteins and nucleic acid encoding the proteins, useful diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 20; Page 242; 460pp; English.

Pena CER. Rieger DK. Rethenberg ME. Schenov MG. Schinchets RA. Spederma SK. Spytek KA. Taupker RE. Twomlow N. Vernet CAM. Vose EZ. Zechusen BD. Zhong N. WPI: 2003-313241/30. P-PESDR, Amstages. Noval human proteins and mucleic acid encoding the proteins, where X is a chimacosts, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders. Claim 20; Page 246, 460pp. English. The prosent invention describes incole the human NOWX proteins, where X is 1 to 42. Co56223 to Accessable encode the human NOWX proteins of the cardiac and neurological disorders. ABSELIC: antilideric antilingericity, hereosetatic, ministaberosclerotic, cardiant, hypotensive, dermacological, anorectic, immunosuppressive, optensation, antidaberic, antilingericity, hereosetatic, ministaberoscleroty, anti-sity, antidaberic, dermacological, anorectic, immunosuppressive, cytestarid, hypotensive, dermacological, anorectic, immunosuppressive, cytestarid, antibodies can be used in the treatment and disgnosts of cardiant, hypotensive, thermacological, anorectic, and proventing a pathony associated with a KONY protein in humans and for treating a pathony associated with a KONY protein in humans and for treating a pathony associated with a KONY protein in the access and protein contexts, cancer, anorectic, antipathy and the protein and antibodies can be used in the treatment and disgnosts of cardinary hypoteosety, protein and anorexia, cancer associated cachests, cancer, hypoteosety, protein and protein protein and anorexia, cancer, hypoteosety, protein and anorexia, cancer associated cachests, cancer, hypoteosety, protein and anorexia, cancer-associated cachests, cancer, hypoteosety, protein and the acceptance and anothers, and the respective protein and hypoteo

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X.

ACC62346 to ACC62465 represent PCR primers and probbes for human NOVX sequences, which are used in examples from the present invention.

ABR54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present in to 42. Novel human proteins and nuclair acid encoding the proteins, useful for diagnosis, treatment and prevention of disporders involving the human protein or muclair acid e.g. cardiac and neurological disorders. Claim 20; Page 240-241, 46pp; English. The present invention describes isolated human NOVX proteins years in ABS3167 to ABS4276. NOVX sequences have anniable proteins given in ABS3167 to ABS4276. NOVX sequences have anniable proteins given in ABS3167 to ABS4276. NOVX sequences have anniable received the proteins given in ABS3167 to ABS4276. NOVX sequences have anniable received the proteins given in ABS3167 to ABS4276. NOVX sequences have anniable received the proteins given in ABS3167 to ABS4276. NOVX sequences have anniable received the proteins given in ABS3167 to ABS4276. NOVX sequences have anniable received the proteins given in the treatment and for treating any developed, which a NOVX protein in humans and for treating a price of the proteins given the proteins given the proteins given in the treatment and diagnosis of cardiamy selections are all propriates, proteins and for treating a price of the proteins given in the proteins. Crohn staces, diabetes, metabolic disorders, neeplasm, Jymphoma, uterus cancer, fertility, haemophilia, hypercoaghi, cancer associated carbania, cancer subscited carbania granter of disease, annual disorders, metabolic proteins given in concerns an interest of disease, annual disorders, metabolic proteins given in the present invention of the present invention of the human NOV35b protein in the exemplia feating given in comparison with the human NOV35b protein in the exemplia feating given in comparison with the human NOV35b protein in the exemplia feating given in comparison with the human NOV35b protein in the exemplia feating given in comparison with the human NOV35b protein in the exemplia feating given in comparison with the human NOV35b protein given in compa	Agee ML, Alsobrook JP, Anderson DW, Berghs C, Boldog FL; Burgess CE, Casman SJ, Catterton E, Chant JS, Chaudhuri A; Crabtree J, Dipippo VA, Edinger SR, Eisen AJ, Ellerman K; Gangolli EA, Gerlach VL, Giot L, Gorman L, Guo X, Gusev VY, Ji W; Kekuda R, Khramtsov NV, Leach MD, Lepley DM, Li L, Liu X; Malyankar UM, Miller CE, Ooi CE, Ort T, Padigaru M, Patturajan M; Pena CEA, Rieger DK, Rothenberg ME, Shenoy SG, Shimkets RA; Spaderna SK, Spytek KA, Taupier RJ, Twomlow N, Vernet CAM, Voss EZ; Zerhusen BD, Zhong M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method of treating a human subject having a tumourigenic disorder or angiogenic disorder, caused by aberrant gene expression or activity of an isolated protein, by administering a modulator. The modulator may have cytostatic, antithyroid, antidiabetic or ophthalmological activity. The method is useful for treating a subject having a tumourigenic or angiogenic disorder, in particular for treating cancer (for example breast cancer, colon cancer, lung cancer or prostatic cancer) and, for example, Grave's disease and diabetic retinopathy. The protein 9389 of the invention.

                                                                                                                                                                                                AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. AAH37196 to AAH37204 and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922

TEXE EXELECTION OF SOLUTION OF The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in C ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiatherosclerotic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, replasm, lymphoma, uterus cancer, diabetes, metabolic disease, allow, idiopathic thrombocytopenic purpura, graft versus host confectious disease, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, anorexia, cancer-associated cachexia, cancer, hamman source associated cachexia, cancer, anorexia, cancer-associated cachexia, cancer, caches, which are used in examples from the present invention.

CC ABR54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention. Spaderna Zerhusen WPI; 2003~313241/30.
p-PSDB; ABR54268.

Novel human proteins and nucleic acid encoding the proteins, useful diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                            60
                                                                                                           RESULT 2
US-10-193-295-1
; Sequence 1, Application US/10193295
; Patent No. 6620608
; GENERAL INFORMATION:
APPLICANT: GONG, Fangcheng et al.
TITLE OF INVENTION: ISOLATED HUMAN ENZYME PROTEINS, NUCLEIC
TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN ENZYME PROTEINS, AND
TITLE OF INVENTION: THEREOF
FILE REFERENCE: CL001195DIV
CURRENT APPLICATION NUMBER: US/10/193,295
; CURRENT FILING DATE: 2002-07-12
pRIOR APPLICATION NUMBER: 08/819,993
pRIOR APPLICATION NUMBER: 08/819,993
pRIOR FILING DATE: 2001-03-29
NUMBER OF SEQ ID NOS: 5
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 1
LENGTH: 2002
TYPE: DNA
ORGANISM: Human

US-08-305-505-1

; Sequence 1, Application US/08305505

; Patent No. 5668001

; Patent No. 5668001

; GENERAL INFORMATION:
  APPLICANT: Miziorko, Henry M.
  TITLE OF INVENTION: 3-HYDROXY-3-METHYLGLUTARYL-COA

; TITLE OF INVENTION: SYNTHASE PREPARATION WITH IMPR

; TITLE OF INVENTION: STABILITY

NUMBER OF SEQUENCES: 6

; CORRESPONDENCE ADDRESS:
  ADDRESSEE: Quarles & Brady
  STREET: 411 East Wisconsin Avenue
  CITY: Milwaukee
  STATE: Wisconsin
  COUNTRY: U.S.A.
  ZIP: 53202

TITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY AND
TITLE OF INVENTION: DIAGNOSIS OF COLON CANCER AND METH
FILLE REFERENCE: 210121.471C2
CURRENT APPLICATION NUMBER: US/09/401,064
CURRENT FILING DATE: 1999-09-22
NUMBER OF SEQ ID NOS: 371
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 187
LENGTH: 506
TYPE: DNA
ORGANISM: Homo sapien
